

Clients can ease their workload with new tools and features that make *CareWebQI*® Version 1.9 the best care management application since the patient chart. This latest release of the flexible software package that makes the *Milliman Care Guidelines*® clinical content interactive and reportable now adds the workflow, security, data management and quality measure tools requested by clients.

### Medical Management Module

This new, optionally licensed module, supports management of day-to-day operational workflow and medical director-level reviews. The Medical Management Module includes a work queue to keep track of assigned patient episodes, and a task list for users to create and manage reminders, follow-ups and other items. It also supports timely patient episode review, routing, and maintenance. This module adds several of the important functions of a full care management system to *CareWebQI*.

### Bulk Data Load Tool

Clients can save time and steps by accessing this new data tool from within *CareWebQI* to validate and input files, schedule data loads, control load frequency, and view activity files on-line. The Bulk Data Load Tool is available to hosted or locally installed clients and includes a new Bulk Load Activity log file.

### HL7 Integration Tool

*CareWebQI* now includes software allowing hosted or locally installed clients to upload sensitive, HIPAA-protected healthcare data from care management systems using the secure HL7 data standard. All new and customized *CareWebQI* data fields are available to receive secure HL7 data through third-party interface tools.

### Multi-Facility System Security

This major enhancement enables clients with one corporate or “parent” license to share one instance of *CareWebQI* with multiple participating facilities. Clients may now control user access to guidelines through individual facility license keys.

- **Quality Measure Reports** – Robust new reports are based on measures from the Hospital Quality Alliance, NCQA and Joint Commission. *Chronic Care Guidelines* quality measures are now also interactive and reportable.
- **Configurable Episode Summaries** – Clients may now select the type of data displayed in the episode summary, sending only the most appropriate information to other organizations.
- **Daily Attending Provider** – A new field tracks and reports on individual attending providers for each day in a progression.
- **Diagnosis Present on Admission Flag** – This new field indicates that a diagnosis was present on admission, for accurate reporting and auditing of clinical conditions.
- **Online Help** – A new interactive online help feature makes it easy to search and find information about every aspect of *CareWebQI*.
- **Enhanced Reports** – *CareWebQI* reporting performance has been enhanced with the new Web-based Active Reports tool.
